**NAME**

MARC::Charset::Greek - MARC8/UTF8 mappings

**SYNOPSIS**

```
use MARC::Charset::Greek;  
my $cs = MARC::Charset::Greek->new();
```

**DESCRIPTION**

MARC::Charset::Greek provides a mapping between the MARC8 Greek character set and Unicode(UTF8). It is typically used by MARC::Charset, so you probably don't need to use this yourself. It inherits from MARC::Charset::Generic so you'll need to look at those docs to see all the methods that are available.

**METHODS**

The constructor, which will return you a MARC::Charset::Greek object.

**lookup()**

The workhorse method that does the lookup. Pass it an a character and you'll get back the UTF8 character.

**combining()**

Pass it a character and you'll get back a true value (1) if the character is a combining character, and false (undef) if it is not.

**TODO**

Nothing

**SEE ALSO**

MARC::Charset::Generic
